"Characterization of the SfiI restriction and modification genes.";
Submitted (DEC-1997) to the EMBL/GenBank/DDBJ databases.
-I- FUNCTION: Recognizes the double-stranded sequence GGCCNNNNNGGCC and cleaves before N-9.
-I- CATALYTIC ACTIVITY: Endonucleolytic cleavage of DNA to give
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CHAIN

FUNCTION: CAN CLEAVE 4-METHYL-, 4-CHLORO-, AND 3-METHOXYCATECHO AT LOWER RATES THAN CATECHOL, BUT HAS NO ACTIVITY WITH 4-NITROCATECHOL OR PROTOCATECHUIC ACID.

CATALYTIC ACTIVITY: Catechol + O(2) = cis,cis-muconate.

COPACTOR: FERRIC ION.

PATHWAY: FIRST STEP IN THE DEGRADATION OF CATECHOL TO SUCCINATI AND ACETYL-COA IN THE BETA-KETOADIPATE PATHWAY.

SUBUNIT: HOMODIMER (POTENTIAL).

INDICTION: BY ANILINE.

SIMILARITY: BELONGS TO THE INTRADIOL RING-CLEAVAGE DIOXYGENASE ENLIGATION:
